Recommendation Letter

To the Admissions Committee:

I am pleased to recommend JiaXin Xing for graduate study in AI Ethics, AI Governance, Technology Governance, Digital Humanities, and related interdisciplinary fields.

I am XingYuan Fu, a Professor in the Department of Landscape Architecture, College of Horticulture, Northeast Agricultural University, and served as JiaXin Xing's Master's supervisor from 2017 to 2019. During her Master's studies, I provided continuous academic supervision of her research and closely followed her academic development.

JiaXin received systematic training in Landscape Architecture at the undergraduate level and subsequently focused on Environmental Psychology and restorative environments during her Master's studies. Her Master's research examined the effects of plant landscape colour on users' psychological restoration in healthcare environments in northern China. The study integrated literature review, environmental assessment, empirical investigation, and quantitative analysis to examine differences in environmental perception among different user groups. The research demonstrated not only her sound ability in research design, but also her potential to translate abstract theoretical concepts into a structured and operational research framework.

During her graduate studies, she participated in several research projects, including studies on the creation of a sense of security in landscape design, landscape preferences and landscape cognition among urban park users, and the application of ornamental grasses in landscape design. She also made substantial contributions to a village planning and design project in northern cold-climate regions, where she was responsible for human-centred improvements to basic environmental infrastructure. These experiences strengthened her abilities in literature synthesis, case collection, data analysis, empirical research, and collaborative project work.

What impressed me most was her ability to transform design-oriented projects into clearly structured research questions, systematically review relevant literature, establish appropriate evaluation dimensions, rigorously analyse empirical data, and subsequently translate research findings back into design practice. She was able to integrate the spatial thinking of Landscape Architecture with the human-centred perspective of Environmental Psychology and restorative environment research, together with quantitative analytical approaches. I consider this interdisciplinary training a strong foundation for her subsequent academic development beyond the field of landscape architecture.

In my view, her current interest in AI Ethics, AI Governance, Technology Governance, and Digital Humanities represents a natural extension of her academic trajectory. Her previous research consistently focused on how people perceive, experience, and respond to their surrounding environments and systems. This human-centred perspective provides a valuable foundation for further examining the increasingly complex relationships between people and technology, and between technological systems and society.

On the basis of her academic performance, research training, and interdisciplinary potential, I am pleased to recommend JiaXin Xing for graduate study in AI Ethics, AI Governance, Technology Governance, Digital Humanities, and related fields. I am confident that she will build upon the research skills developed during her graduate studies and approach her future academic work with the same intellectual rigour, diligence, and commitment.

Sincerely,

Professor
